

Math.Atan2(Rational,Rational) Method

名前空間: WS.Theia.ExtremelyPrecise

アセンブリ: ExtremelyPrecise.dll

タンジェントが 2 つの指定された数の商である角度を返します。

```
public static WS.Theia.ExtremelyPrecise.Rational
Atan2(WS.Theia.ExtremelyPrecise.Rational yCoordinates,
WS.Theia.ExtremelyPrecise.Rational xCoordinates);
```

パラメーター

yCoordinates	Rational
--------------	----------

点の Y 座標。

xCoordinates	Rational
--------------	----------

点の X 座標。

戻り値

Rational

- $\pi/2 \leq \theta \leq \pi/2$ の、ラジアンで表した角度 θ 。

tan が NaN の場合、NaN、tan が NegativeInfinity の場合、-PI/2、tan が PositiveInfinity の場合、PI/2 になります。

例

次の例では、座標からベクトルを算出し、ベクトルの角度からアークタンジェントを計算し、コンソールに表示する方法を示します。

[illegible]

```
using WS.Theia.ExtremelyPrecise;
```

```
class Sample
```

```
{
```

```
    public static void Main()
```

```
    {
```

```
        Rational x = 1.0;
```

```
        Rational y = 2.0;
```

```
        Rational angle;
```

```
        Rational radians;
```

```
        Rational result;
```

```
// Calculate the tangent of 30 degrees.
```

```
    angle = 30;
```

```
    radians = angle * (Math.PI/180);
```

```
    result = Math.Tan(radians);
```

```
    Console.WriteLine("The tangent of 30 degrees is {0}.", result);
```

```
// Calculate the arctangent of the previous tangent.
```

```
    radians = Math.Atan(result);
```

```
    angle = radians * (180/Math.PI);
```

```
    Console.WriteLine("The previous tangent is equivalent to {0} degrees.",  
angle);
```

```
// Calculate the arctangent of an angle.
```

```
    String line1 = "{0}The arctangent of the angle formed by the x-axis and ";
```

```
    String line2 = "a vector to point ({0},{1}) is {2}, ";
```

```
    String line3 = "which is equivalent to {0} degrees.";
```

```
    radians = Math.Atan2(y, x);
```

```
    angle = radians * (180/Math.PI);
```

```
    Console.WriteLine(line1, Environment.NewLine);
```

```
    Console.WriteLine(line2, x, y, radians);
```

```
    Console.WriteLine(line3, angle);
```

```
}
```

```
}  
/*
```

This example produces the following results:

The tangent of 30 degrees is 0.577350269189626.

The previous tangent is equivalent to 30 degrees.

The arctangent of the angle formed by the x-axis and
a vector to point (1,2) is 1.10714871779409,
which is equivalent to 63.434948822922 degrees.

```
*/
```

注釈

戻り値は、原点(0,0)からポイント(x,y)で終了するベクトルと x 軸のプラス方向で形成されるデカルト角度です。
