Rational.NaN Property

名前空間: WS.Theia.ExtremelyPrecise

アセンブリ: ExtremelyPrecise.dll 数 (NaN) を表す値を取得します。

public WS.Theia.ExtremelyPrecise.Rational NaN { get; }

プロパティ値

Boolean

値が非数 (NaN) である Rational オブジェクト。

注釈

NaN は 0 を 0 で除算を行った場合等、数値として定義できない場合に返却されます。0 以外の被除数を 0 で除算した場合は、被除数と除数の符号により、PositiveInfinity、または、NegativeInfinity となります。

```
Rational zero = 0.0; 
Console.WriteLine("\{0\} / \{1\} = \{2\}", zero, zero, zero/zero); 
// The example displays the following output: 
// 0 / 0 = NaN
```

```
Rational nan1 = Rational.NaN;

Console.WriteLine("{0} + {1} = {2}", 3, nan1, 3 + nan1);

Console.WriteLine("Abs({0}) = {1}", nan1,

WS.Theia.ExtremelyPrecise.Math.Abs(nan1));

// The example displays the following output:

// 3 + NaN = NaN

// Abs(NaN) = NaN
```

一般的に NaN に演算子は使用する事ができませんが、比較演算子(Equals、CompereTo等)を使用することができます。次の例では各演算子と値による比較結果を示しています。

```
using System;
public class Example
   public static void Main()
      Console.WriteLine("NaN == NaN: {0}", Rational.NaN ==
Rational.NaN);
      Console.WriteLine("NaN!= NaN: {0}", Rational.NaN!= Rational.NaN);
      Console.WriteLine("NaN.Equals(NaN): {0}",
Rational.NaN.Equals(Rational.NaN));
      Console.WriteLine("! NaN.Equals(NaN): {0}",!
Rational.NaN.Equals(Rational.NaN));
      Console.WriteLine("IsNaN: {0}", Rational.IsNaN(Rational.NaN));
      Console.WriteLine("\forall nNaN > NaN: \{0\}", Rational.NaN >
Rational.NaN);
      Console.WriteLine("NaN >= NaN: {0}", Rational.NaN >=
Rational.NaN);
      Console.WriteLine("NaN < NaN: {0}", Rational.NaN < Rational.NaN);
```

```
Console.WriteLine("NaN < 100.0: {0}", Rational.NaN < 100.0);
      Console.WriteLine("NaN <= 100.0: {0}", Rational.NaN <= 100.0);
      Console.WriteLine("NaN \geq 100.0: {0}", Rational.NaN \geq 100.0);
      Console.WriteLine("NaN.CompareTo(NaN): {0}",
Rational.NaN.CompareTo(Rational.NaN));
      Console.WriteLine("NaN.CompareTo(100.0): {0}",
Rational.NaN.CompareTo(100.0));
      Console.WriteLine("(100.0).CompareTo(Rational.NaN): {0}",new
Rational(100.0).CompareTo(Rational.NaN));
   }
}
// The example displays the following output:
//
         NaN == NaN: False
//
         NaN!= NaN: True
//
         NaN.Equals(NaN): True
//
         ! NaN.Equals(NaN): False
         IsNaN: True
//
         NaN > NaN: False
         NaN >= NaN: False
//
         NaN < NaN: False
//
         NaN < 100.0: False
//
         NaN <= 100.0: False
         NaN >= 100.0: False
         NaN.CompareTo(NaN): 0
//
         NaN.CompareTo(100.0): -1
//
         (100.0).CompareTo(Rational.NaN): 1
```

適用対象

.NET Core

2.0

.NET Framework

4.6.1

.NET Standard

2.0

UWP

10.0.16299

Xamarin.Android

8.0

Xamarin.iOS

10.14

Xamarin.Mac

3.8
